

EXP.NO: 1	Basic Unix/Linux commands
DATE: 06/01/2026	

AIM:

To understand the fundamentals of the Unix/Linux operating system by practicing essential commands for file management, directory operations, permissions, and process handling.

ALGORITHM:

1. Start the experiment.
2. Open the Linux terminal.
3. Display the current working directory using pwd.
4. List files and directories using ls.
5. Create a new directory using mkdir.
6. Change directory using cd.
7. Create a file using touch.
8. Display file content using cat.
9. Copy files using cp.
10. Rename/move files using mv.
11. Delete files using rm.
12. Display hidden files using ls -a.
13. Clear the screen using clear.
14. Stop the experiment.

CODE:

```
# Display current directory
```

```
pwd
```

```
# List files
```

```
ls
```

```
ls -l
```

```
ls -a
```

```
# Create directory
```

```
mkdir MyProject
```

```
# Move into directory
```

```
cd MyProject
```

```
# Create file  
touch file1.txt
```

```
# Add content  
echo "Hello Linux" > file1.txt
```

```
# View content  
cat file1.txt
```

```
# Copy file  
cp file1.txt file2.txt
```

```
# Rename file  
mv file2.txt newfile.txt
```

```
# Delete file  
rm newfile.txt
```

```
# Go back  
cd ..
```

```
# Remove directory  
rm -r MyProject
```

```
# Clear screen  
clear
```

OUTPUT:

```
[hp@localhost MyProject]$ pwd  
/home/hp/MyProject  
  
[hp@localhost MyProject]$ touch file1.txt  
  
[hp@localhost MyProject]$ ls  
file1.txt  
  
[hp@localhost MyProject]$ echo "Hello Linux" > file1.txt  
  
[hp@localhost MyProject]$ cat file1.txt  
Hello Linux
```

RESULT:

Thus, the basic Unix/Linux commands for directory navigation, file creation, viewing, copying, renaming, and deletion were successfully executed on the Oracle Linux system using the terminal.
